

Apps are just the beginning!

How can the 9-1-1 PSAP handle the new flood of information from the “Internet of Things”?

The public's expectation is changing

- But why?
- 9-1-1 Works..

Isn't The Phone Just Another App on your iPhone?

Smartphones have changed the way we live

Estimated

- Precise location (Cell tower, GPS, WiFi Access Points, etc., Altitude reading)
- Real-time health / medical information
- Connection over any medium: PSTN, LTE/4G Data, WiFi
- Camera feed
- Texting *in 15% of PSAPs (typically with Phase 1 location data)*
- Voice
- Camera (Picture and video stream)
- Route planning / directions
- Emergency contacts
- Etc

We Can Use Apps as a Technology Showcase (E911)

- Device-based hybrid location at call time
 - GPS, WiFi Access Points, Cell tower triangulation, Bluetooth Beacons, etc. (Median Accuracy: 16m)
 - Call routing based on handset location, not cell tower location
 - Civic dispatchable address + x/y/z provisioned into the ALI database in real time
- Type of emergency in the ALI display
- Texting as Text-to-Speech for every PSAPs
- Relevant medical & demographic data when the user can't speak or gets disconnected

```

We Can Use Apps as a Technology Showcase (NG911)

- Device-based hybrid location at call time
 - GPS, WiFi Access Points, Cell tower triangulation, Bluetooth Beacons, etc. (Median Accuracy: 16m)
 - Call routing based on handset location, not cell tower location
 - Civic dispatchable address + x/y/z with breadcrumbs in real time
- Type of emergency, Medical & Demographic data, Emergency Contacts on CPE/CAD screen
- Two-way real-time texting, Photo stills, Video stream

Apps are just the beginning

Apps morph into

1

Internet of Things

*“If you can make an App call 9-1-1,
you can make anything call 9-1-1”*

Apps incubate technology for

2

Wireless 9-1-1 Calls

*“Why isn’t this standard for
every wireless 9-1-1 call?”*

The Internet of Things and 9-1-1

The Internet of Things and 9-1-1

Who Cares?

Data Module

A Location

Device-based hybrid location from Cell Network, GPS, WiFi Access Point, Bluetooth Beacons, Barometric Pressure, User-input & Context

More accurate, faster, updates automatically

B Additional data

Medical & demographic data, emergency contacts

C Multimedia

Two way texting, Photo stream, Live Video

Category

1 **Unknown location**

2 **Unable to speak**

3 **Caller in motion**

4 **Medical history**

5 **Disability indicator**

6 **Emergency contacts**

7 **Photo stills**

8 **Video stream**

9 **Texting**

Story “from the trenches”

Car crash – “I don’t know where I am”

Domestic violence / open line

Abduction, fast-moving target

Diabetes- medical dispatch

Deaf / hard of hearing

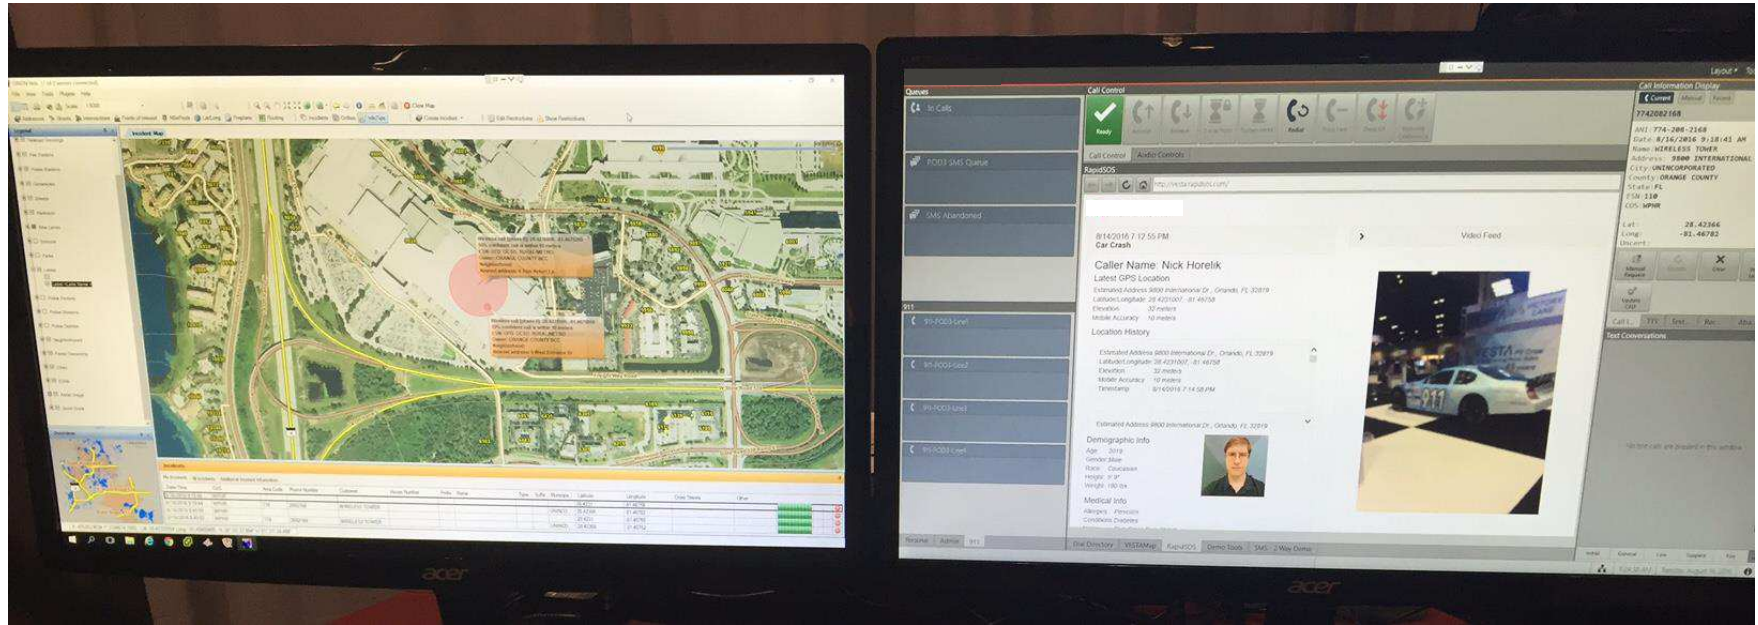

Contact next of kin / imminent danger

Active shooter event

Building fire

Speech impairment (e.g., Stroke)

How could this look like in the PSAP?

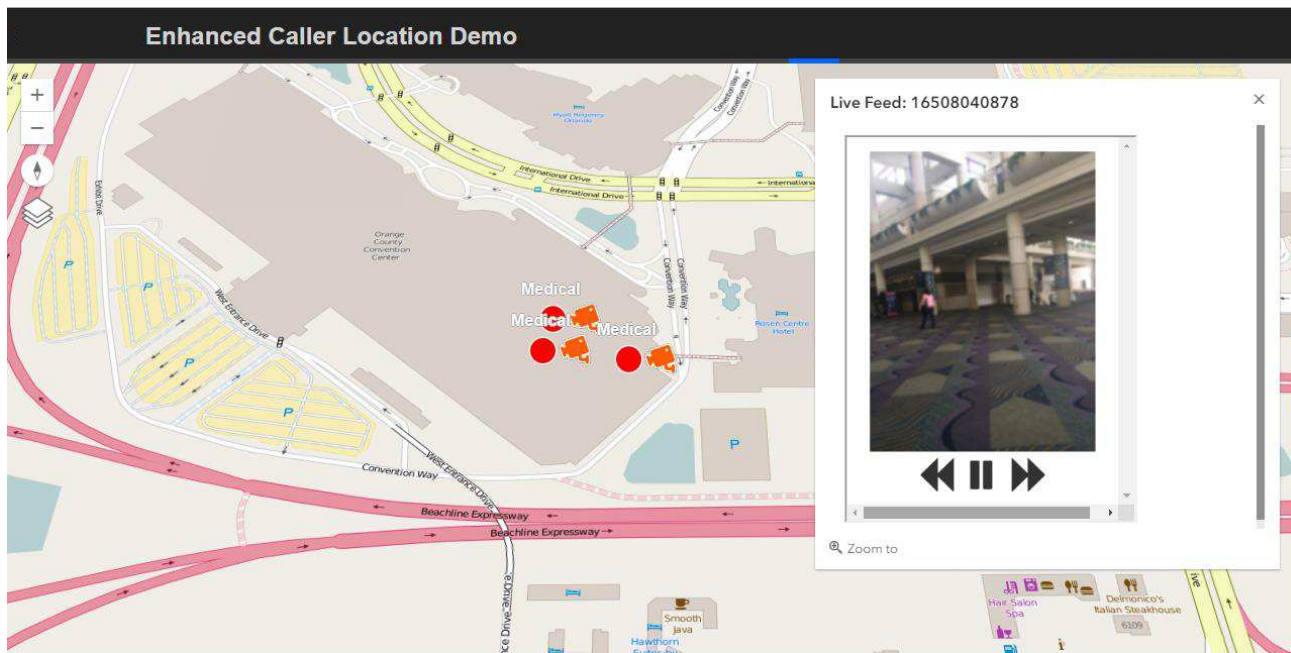

1) Better location

2) Additional data

3) Multimedia content

E911: Response on query

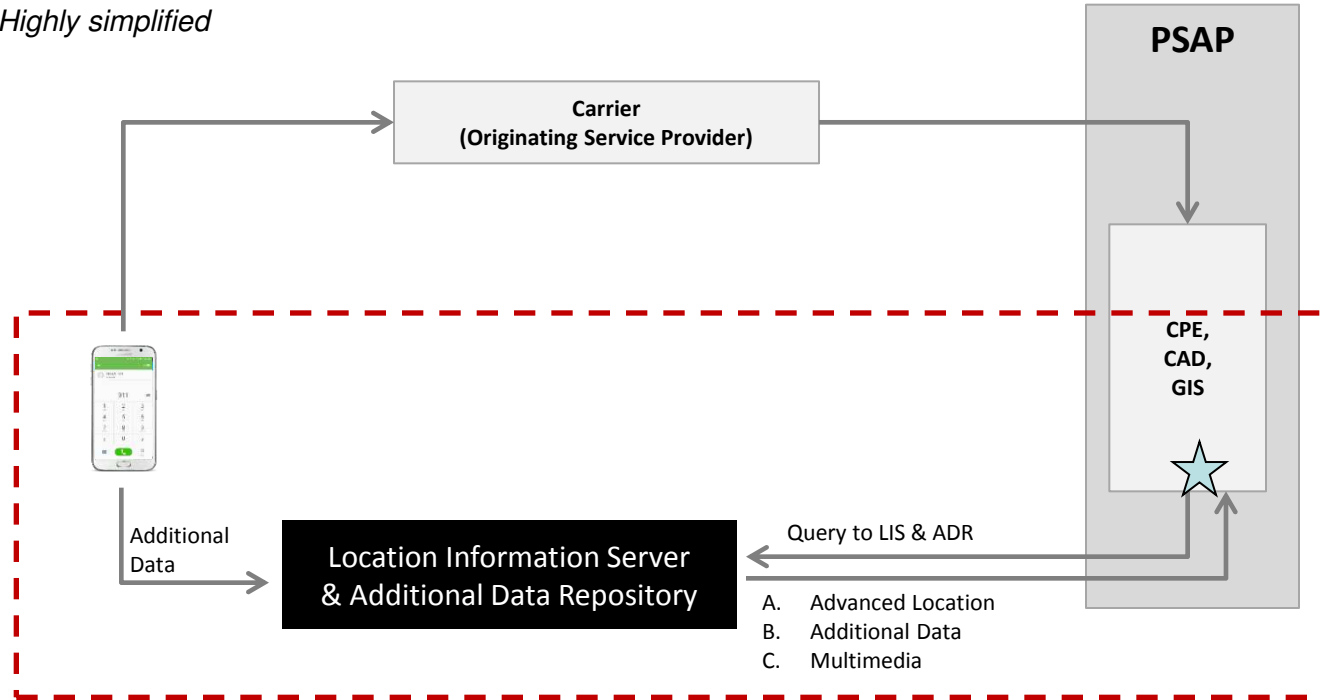

1) Better location

2) Additional data

3) Multimedia content

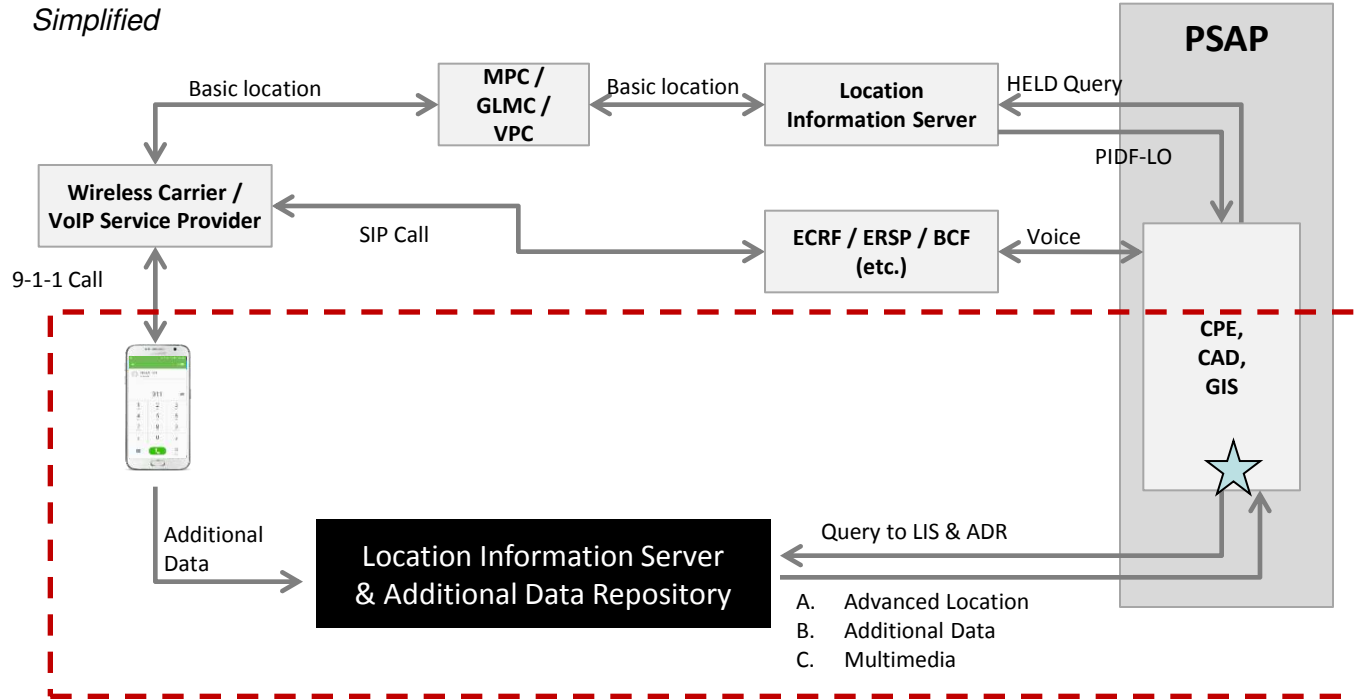

NG911 Transport Mechanisms, separate from call

Highly simplified

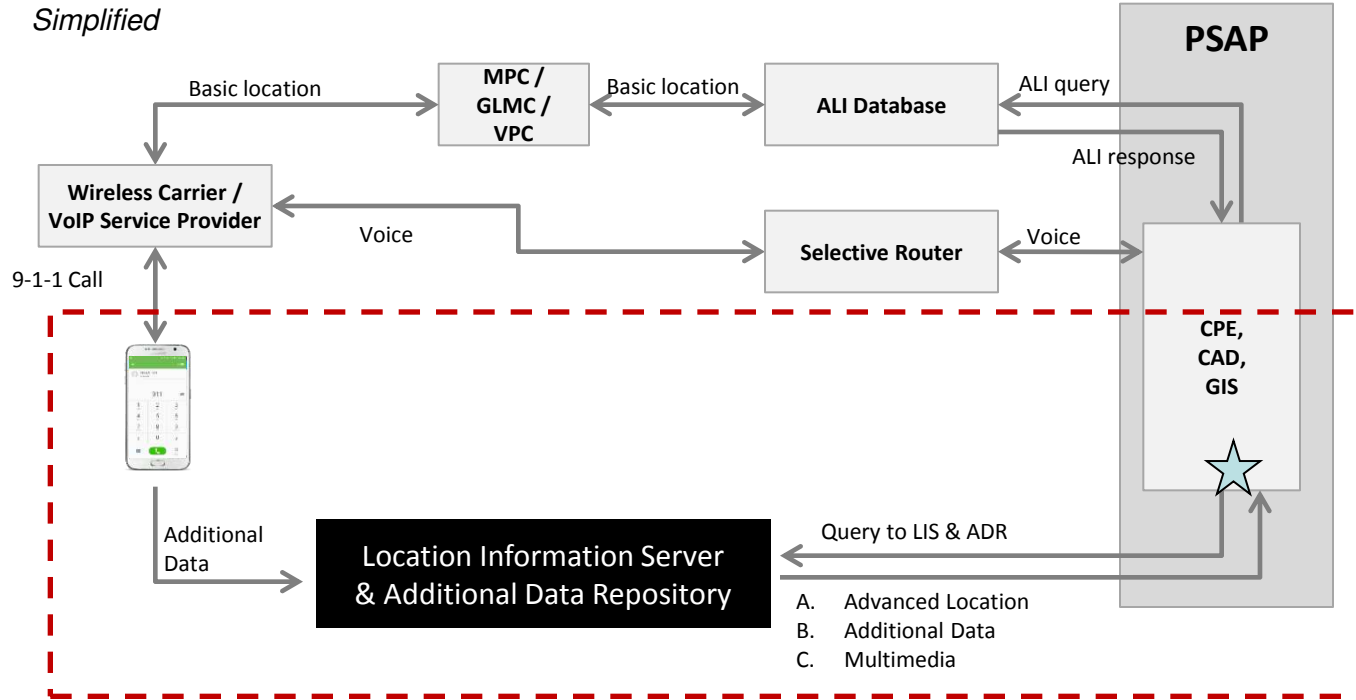

Enhanced location & additional data/multimedia, separate from regular 911 call flow

NG911 Transport Mechanisms, separate from call

Enhanced location & additional data/multimedia, separate from regular NG911 call flow

NG911 Transport Mechanisms, separate from call (E911)

Enhanced location & additional data/multimedia, separate from regular E911 call flow

Closing the Loop: Wireless 9-1-1 Location

Cell Tower Triangulation:

Reliable, but not very accurate

GPS:

Highly accurate & reliable (outdoors)

WiFi Access Points:

Highly accurate indoors, and it's getting better and better

Bluetooth Beacons:

Potentially highly accurate indoors (Let's see)

Barometric Pressure:

Altitude reading (z-axis)

Device-based hybrid location is faster & more accurate

Closing thoughts

- If an app can do it, any connected device should be able to do it.
- If an app can do it, any wireless call should ultimately be able to do it.
- After all, isn't the native dialer just another app on your smartphone?
