Securing Public Safety Networks

November, 2016

Gerald "Jay" English, ENP Public Safety Program Manager US Dept. of Homeland Security DHS - NCC

- Overview
- Threat Landscape
- TFOPA Cybersecurity Report
- The Future

Overview

- As Public Safety Answering Point (PSAP) 911 networks transition from TDM-based to IP-based architecture they will face increasing exposure to cyber threats and vulnerabilities that did not exist in the legacy 911 environment.
- Existing work including the NIST Cybersecurity Framework, the ongoing work of CSRIC and the FCC, the recently formed FCC TFOPA and other foundational documents, can assist in cyber risk management strategies for the ecosystem as a whole
- Cyber risk management strategies must be implemented at multiple levels from core services to the PSAP level.

The Threat

- Advanced technologies are becoming more integrated into public safety communications networks
- New and emerging cyber risks are an increasing concern
- Many initiatives to mitigate and combat these risks are underway in both the public and private sectors to keep these systems safe and secure

The Threat

- **Destruction:** Physical destruction of information or communications systems rendering them unusable
- **Corruption:** The changing of information such that it is no longer accurate or useful
- **Removal:** The removing of information so that it cannot be accessed, but is not destroyed
- **Disclosure:** Unauthorized release of confidential or sensitive information to the detriment of owner of said data
- Interruption: Interfering with communications such that legitimate users cannot send or receive messages

Cyber Threat Landscape

- Cyber Threat Actors
 - State Sponsored
 - Terrorist/Violent Extremists
 - Insider Threat
 - Hackers
 - Hacktivists
 - Criminals / Organized Crime

2016 What happens in an **Description 2016 INTERNET MINUTE?**

CYBER THREAT TRENDS

November 1-2, 2016 • Seattle, Washington

- ENORMOUS increase in Cyber Attacks/Crime both in numbers and sophistication.
 - State sponsored attacks likely to increase. (Cyber Warfare is real now.)
 - CYBER CRIME as a SERVICE
 - Cyber-weapon toolkits

Nation-States That Have Declared Offensive Cyber Capability

- Iran
- India
- UK
- China
- Russia
- U.S.A.

- Australia
- Italy
- France
- Syria
- Germany
- Israel

Hactivists

- Alliances with ideologically similar groups
- More Skilled
- More Organized
- More Aggressive
- More of them

Cyber Criminals

- Can occasionally approach the sophistication if not the endurance of State sponsored attackers
- Adding much more emphasis to mobile devices.
- Adds a physical dimension to the Cyber realm.

Attacks, and more attacks

"Hardly a day goes by lately when we don't hear about a massive data breach. ...no matter where your personal data resides it seems wide open to malicious attack. Research shows that there have been 2,928 publicly disclosed attacks *so far* in 2016 involving greater than **2.2 billion records** in total.

Sometimes, you know that you're a victim of a data breach...however, as with the recent data breach at Modern Business Solutions (MBS), you may not even be aware that the company exists..." ¹

MBS Attack – October, 2016

"MBS is a company specializing in providing in-house data management and monetization services to other companies. If you're an MBS customer, then you probably don't even know it, and the 58 million stolen database records could belong to just about anyone

At this point, there's some confusion as to the actual number of records that were released. While it's <u>at least 58 million</u>, it <u>could be as many as 258</u> million based on an analysis of the database involved. While research is ongoing, it's entirely possible that we'll never know exactly how much data was released and who was affected." ²

Cybersecurity : Optimal Approach for PSAPs Emerging Technology Forum

The defined scope of this work was limited to the identification of cybersecurity issues and documentation of recommended cybersecurity practices for Public Safety Answering Points. However, in the context of this work effort, a local PSAP is much more than a stand-alone entity but rather is the connection point in a complex system of integrated networks that form the critical infrastructure necessary to enable delivery of life saving services. Therefore, as a necessity, there must be reference to other network elements outside of the local PSAP construct.

- The reduction of any cybersecurity framework to practice is rooted in the ability to identify assets, owners of these assets, threats/risks to these assets, and methods to mitigate the threats/risks.
- Current and NG architectures serve as a starting point to understand the PSAP ecosystem.
- Forward looking issues used to expand the context of the threat to the PSAP as a result of the expansion of the public safety ecosystem.
- Use cases are used to communicate the types of cybersecurity threats to PSAPs
- Finally, based on the foregoing, the Working Group developed a checklist and roadmap for PSAPs and a set of recommendations.

- NIST Cybersecurity Framework (NCF)
- Identity Credentialing Access Management (ICAM)
- DHS recommendations and resources
- NICE Workforce Framework
- CSRIC Best Practices Related to Public Safety

- U.S. Department of Commerce
 - NIST: Cybersecurity Framework
 - NIST: Cyber Physical Systems- Public Work Group Report
 - Relationship To PSAPs: Identify, Protect, Detect, Respond, Recover
 - NICE Workforce Framework
 - Relationship of occupational specialties to PSAPs
 - Define any new/missing occupational specialties
 - Consider Cyber Professional Best Practices for PSAP workforce

- Department of Homeland Security
 - Critical Infrastructure Cyber Community Voluntary Program (C3VP)
 - Critical Infrastructure Cyber Information Sharing and Collaboration Program (CISCP)
 - Cyber Reports & Recommendations
 - Cybersecurity Products & Solutions:
 - National Cybersecurity and Communications Integration Center (NCCIC)
 - NCCIC/National Coordinating Center for Communications (NCC)
 - NCCIC/United States Computer Emergency Readiness Team (US-CERT)

Cybersecurity For The Future

- The threat is real and increasing
 - TDoS and DDoS attacks have occurred, and continue to occur in a legacy environment
 - Both criminal and Nation State actors are involved
- This threat will increase exponentially as we transition to IP based architectures
- We must think "outside the box" and consider unifying, information sharing based, architectures and options.

Cybersecurity For The Future

- The Emergency Communications Cybersecurity Center (EC3)
 - Description of Intrusion Detection and Prevention Systems
 - Proposed Approach for IDPS in the NG9-1-1 Environment
- The EC3 Concept Explained
- Cost Considerations

Emergency Communications Cybersecurity Center

Distributed Integration of EC3 Deployments

November 1-2, 2016 • Seattle, Washington

- A realistic self assessment for public safety communications entities and agencies to evaluate their current cybersecurity capabilities and risks;
- A roadmap for the creation and implementation of a successful Cybersecurity strategy that applies to local public safety levels of government, up to and including State level government
- Cyber risk mitigation strategies for interconnectivity with potential federal level resources and capabilities.

- Given the scope of Next Generation communications networks and systems as a whole, it is impossible to delve into Cybersecurity considerations for PSAPs without taking into account the existing capabilities of the eco-system of various commercial providers who interact with public safety.
- These include, but are not limited to,
 - 911 Customer Premise Equipment (CPE) providers, Computer Aided Dispatch (CAD) providers, Records Management Systems (RMS) providers, Radio/Dispatch Console providers, Mobile Data providers, Telecommunications Network & Service providers, Public safety database infrastructure providers, and providers of interconnect services at both the voice and data levels.

- In addition to discussions that identify the threats already known, and available mitigation strategies, focus should be placed on procedures to Respond, Remediate, Restore and Resolve ("the 4R's).
- Suggested steps include both notification and recognition of an attack occurring in network elements outside the direct control of PSAPs.

• Not only the physical elements of cybersecurity should be addressed. As noted in much of the work already done by NIST and DHS, the human factor is vital when preparing for and defending against cyber threats.

• Personnel security including cyber hygiene, training, and other mitigation steps related directly to the personnel involved with day to day operations and maintenance of any public safety system is key.

Next Steps

- The success of any cybersecurity strategy is rooted in the ability to identify assets, owners of these assets, threats/risks to these assets, and methods to mitigate the threats/risks.
- Forward looking issues must be examined to expand the context of the threat to the public safety communications as a result of the expansion of the public safety ecosystem
- This must include additional information sources and new "players" such as FirstNet, Health care providers, public safety "Apps", and other entities that reflect the emergence of new technologies.
- Self assessment of current capabilities, initiation of training, and incorporation of cybersecurity into all new architectures is critical to success.

Cybersecurity is a Risk for Public Safety

The security "DNA" of our networks will define our success
